Patient Name: HANDROP, RONALD

Date of Birth: 12/07/1954

Account/ID: HARO6CV0

Study Date: 11/09/2023

Referral By: Sanjay Ghosh, M.D.

PROCEDURE: CR Cervical (SPINE CERV 4V)

HISTORY:

Chronic neck pain

TECHNIQUE:

AP lateral flexion extension images of the cervical spine were obtained.

No prior studies were available for comparison.

FINDINGS:

There is mild straightening of the normal cervical lordosis. Apart from mild disc space narrowing at the C6-C7 level the disc spaces are maintained. Anterior endplate ridging and spurring is present at the C5-C6 level. There is moderately advanced facet arthropathy, worse to the left. Element of underlying developmental narrowing of the central canal from C3 through C5 is suspected. No fractures are identified. The prevertebral soft tissues appear within normal limits.

On the lateral flexion extension images there is generalized hypomobility of the spine. There is mild (2 mm) anterolisthesis of C4 on C5 with flexion, this reduces to normal alignment with extension. Apart from this no abnormal motion is observed. There is no evidence of atlantoaxial subluxation.

IMPRESSION:

1. Rather advanced facet arthropathy, worse the left.
2. Mild straightening of the normal cervical lordosis.
3. Disc space narrowing at the C6-C7 level.
4. Underlying developmental narrowing the central canal suspected from C3 through C5.
5. Generalized hypomobility the spine is noted. There is no evidence of atlantoaxial subluxation.
6. Mild motion observed at the C4-C5 level as described above.
