Triage Narrative:
PT C/O MVA EARLIER TODAY, WAS RESTRAINED DRIVER OF VEHICLE THAT WAS REAR ENDED WHILE TRYING TO MAKE A RIGHT TURN BY A DRIVER TRYING TO CUT HIM OFF TRAVELING AT A HIGH SPEED, NO AIRBAG DEPLOYMENT, NO SPLINTERING OF WINDSHIELD, PT DENIES LOC, SELF EXTRICATED FROM VEHICLE, WAS ENCOURAGED TO GO TO ED BY MEDICS WHO ARRIVED ON SCENE OF CRASH AND INFORMED HIM THAT HE HAD AN ELEVATED BP AND HR AFTER THE EVENT; PT AOX4, SPEAKING IN CLEAR COMPLETE SENTENCES, MOE, PMS INTACT, AMBULATORY WITH STEADY GAIT INDEPENDENTLY
Entered by: Higdon, Katherine at 10/18/2023 19:01

Chief Complaint:
Motor vehicle crash - minor

History of Present Illness:
The patient is a 68-year-old male with a history of prediabetes and hypertension who was restrained driver today on the street who was rear-ended at unknown speed. The patient is complaining of neck pain headache and right elbow pain and some mild right chest wall pain. The patient denies any loss of consciousness, blood thinner use, shortness of breath. The patient self extricated and he was wearing a seatbelt. He has no severe abdominal pain. He did not have any airbags deployed. His headache is 7 out of 10 along with his right elbow pain.

Problem List & Past Medical/Surgical History:
Acute sinus infection
Post-nasal drip
Sleep apnea with use of continuous positive airway pressure (CPAP)

Social History:
currently denies alcohol
currently denies tobacco or drug use

Allergies:
NKA
No Known Medication Allergies

Vital Signs

BP: 147/97 mmHg **Temp (Oral):** 36.8 DegC (98.2 DegF) **HR:** 81 bpm **Resp:** 18 br/min **SpO2:** 98 %

VITAL SIGNS: Reviewed by me

GENERAL: Alert. well nourished.

HEAD: Head is normocephalic. No evidence of trauma. No scalp or facial swelling or tenderness.

EYES: No scleral icterus. No conjunctival injection

ENT: Nares are clear of exudates and erythema. Oropharynx is clear of exudate and erythema.

NECK: Supple. Full range of motion. No c-collar upon arrival, midline cervical spine tenderness. Patient placed in a Aspen collar

CHEST/Lungs: Chest wall stable, clear to auscultation bilaterally. No tachypnea. speaking in full sentences, no tripodding, no accessory muscle use, Trachea midline

CV: Regular rate and rhythm, no murmurs, Capillary refill and distal perfusion normal in all 4 extremities

ABDOMEN: No seatbelt sign, pelvis stable soft, non-distended, non-tender; No guarding; No rebound; No palpable/pulsatile masses.

EXTREMITIES: Normal to inspection and palpation. No deformities seen. FROM all joints and no bony tenderness. Right upper extremity lateral epicondyle swelling and tenderness to palpation, mild tenderness to the olecranon, full range of motion, all compartments soft

BACK: No CVA tenderness, no thoracic or lumbar spine pain or tenderness

SKIN: Warm and dry. No petechiae or purpura

NEUROLOGIC: speech clear, responds appropriately to questions. Face is symmetric. Speech is normal. Moves all extremities equally. Full range of motion of all 4 extremities full strength

PSYCH: calm and cooperative, linear thought process

Test Results:

Microbiology Results:

Diagnostic Results

CT Head w/o Contrast

Performed By/Author: Gore MD, Ashwani on 18 OCT 2023 22:32 PDT

IMPRESSION:

No acute traumatic intracranial abnormality.

CT Spine Cervical w/o Contrast

Performed By/Author: Gore MD, Ashwani on 18 OCT 2023 22:34 PDT

IMPRESSION:

No acute fracture or traumatic malalignment on CT of the cervical spine without contrast. Indeterminate sclerotic lesion abutting the superior endplate on the right aspect of the T1 vertebral body measuring approximately 1 cm. Differential diagnosis would include a bone island however, malignancy/metastasis is not definitely excluded. Correlate for any history of malignancy.

XR Elbow Complete Right

Performed By/Author: Rajebi MD, Hamid on 18 OCT 2023 22:04 PDT

IMPRESSION:

No definite acute displaced fracture or dislocation. Minimal cortical irregularity along the olecranon of ulna favored to represent chronic injury. If there remains clinical concern for acute osseous abnormality, consider CT scan.

XR Chest 1 View

Performed By/Author: Rajebi MD, Hamid on 18 OCT 2023 22:03 PDT

IMPRESSION:

Hazy and patchy bibasilar lung opacities may represent atelectasis versus developing pneumonia.

Facility: **Sharp Memorial Hospital**

Emergency Documentation

CT Elbow w/o Contrast Right

Performed By/Author: Rajebi MD, Hamid on 19 OCT 2023 00:15 PDT

IMPRESSION:

1. Small osseous fragments about the coronoid and olecranon processes of the ulna, suggestive of recent avulsion injuries. 2. Apparent nondisplaced mild impaction fracture about the posterior lateral humerus nonarticular surface.

EKG Results

No ECG- 12 Lead Results Found.

Emergency Department Course and Procedures:

Other Orders

Consult to Healthy Aging Team (HAT) 10/18/23 21:00:00 PDT, Meets criteria to Program

Medical Decision Making:

1. Number and Complexity of Problems Addressed: Patient presents with undiagnosed new problem with uncertain prognosis.

A broad differential diagnosis was considered, including many potential life/limb threatening conditions, as discussed in the Assessment and Plan.

Comorbidities/underlying diseases, considered and directly addressed, which increase the complexity of data and/or morbidity of patient management:

Acute sinus infection

Post-nasal drip

Sleep apnea with use of continuous positive airway pressure (CPAP)

2. Amount and/or Complexity of Data to Be Reviewed and Analyzed:

Category 1 (Tests, documents, or independent historian) Total Score: (3+)

Ordering each unique test (3+);

Review of prior external note(s) from each unique source (1);

Review of the result(s) of each unique test (3+);

Assessment requiring an independent historian (N/A)

[

CT Head w/o Contrast

CT Spine Cervical w/o Contrast

XR Chest 1 View

XR Elbow Complete Right

Consult to Healthy Aging Team (HAT)

]

Category 2: Independent interpretation of tests: Yes, there was independent interpretation of tests, such as X-ray, EKG, ultrasound, CT scan, rhythm strip interpretations, etc...

Category 3: Discussion of management or test interpretation: None

3. Risk of Complications and/or Morbidity or Mortality of Patient Management: ED course included prescription drug management (administered, prescribed, or evaluated current medications).

The patient presents to the emergency department with acute onset acute headache neck pain and right elbow pain after motor vehicle collision where he was rear-ended. Radiology studies were ordered and independently reviewed.

Facility: **Sharp Memorial Hospital**

Emergency Documentation

Given the patient's presentation, I was concerned for potentially acute life-threatening illnesses and evaluation was undertaken to rule out such illnesses.

Fortunately, there is no evidence of intracranial hemorrhage or skull fracture. CT head was unremarkable. There is no evidence of cervical spine injury or fracture. CT c-spine reviewed and shows no fracture or e/o ligamentous injury. Pt re-examined. FROM at the neck without pain, hesitation, or induced paresthesias. Motor intact throughout and no evidence of central cord syndrome. No clinical e/o acute ligamentous injury. C-spine cleared. There is no evidence of life-threatening intrathoracic pathology such as hemothorax or pneumothorax. There is no evidence of intra-abdominal traumatic injury such as hemorrhage or organ rupture. There is no evidence to suggest thoracic or lumbar spinal fracture or burst fracture or other spinal injury. The CT of the right elbow showed olecranon fracture and distal lateral humerus fracture nondisplaced. He was placed in a sling and was instructed to follow-up with Dr. Ruby the orthopedic surgeon on-call. He was neurovascular intact. I plan for trial of symptomatic measures and close primary care follow-up.

Consideration of Admission: Admission considered, but ultimately, after extensive workup and reevaluation, does not appear to be indicated at this time. I judge the possibility of clinical deterioration unlikely and I believe the patient is a reasonable outpatient candidate. Prescription medications such as narcotic pain medications, anti-inflammatories, antibiotics, and gastric acid reducers were considered. Patient advised to follow-up expeditiously with primary care given their problems evaluated today, as the patient's condition will require ongoing management. Given present risks, patient also advised to return to the emergency department immediately for any deterioration of their condition or lack of improvement.

Referral for suspected pre-hypertension or hypertension was given.

Please note: Unless specifically stated, all procedures mentioned, tests done and medications given were performed/interpreted by the emergency physician.

This ED Note was completed using voice-recognition transcription and may contain inadvertent errors.

Impression:

Acute headache
Acute neck pain
Acute right elbow contusion and pain
acute motor vehicle collision

Plan:

Discharge

Follow Up

Kim Ruby Within: 3 to 5 days

Comments: Return to the ED for severe pain, fevers or difficulty breathing. Please use the sling until you see the orthopedic surgeon or your primary care doctor in the next 1 to 2 weeks. Please call their office tomorrow to make an appointment.

Patient Education

Olecranon Fracture
Distal Humerus Elbow Fracture

Discharge Meds

ibuprofen 400 mg 2 tab, PO, BID, 20 tab
traMADol 50 mg 1 tab, PO, Q12H, 10 tab

Referral for suspected pre-hypertension or hypertension was given.

Comments:

Return to the ED for severe pain, fevers or difficulty breathing. Please use the sling until you see the orthopedic surgeon or your primary care doctor in the next 1 to 2 weeks. Please call their office tomorrow to make an appointment.

You have been seen in the Emergency Department today. Please read these instructions carefully.

You should call 911 for any emergency: *Contact your physician if you are experiencing breathing difficulty or shortness of breath and/or sudden weight gain.*

It is your responsibility to contact the doctor named below for a follow-up appointment. Please TELL THE OFFICE THAT THIS IS A FOLLOW-UP VISIT FROM SHARP MEMORIAL'S EMERGENCY DEPARTMENT.

If your condition worsens and you are unable to contact the above physician, call or return to the Emergency Department.

Hypertension/Pre-Hypertension Follow-up: Your blood pressure today indicates you may be pre-hypertensive or hypertensive. We recommend a rescreen of your blood pressure within 4 weeks and follow up with an alternative or primary care provider.

FOR COVID TEST RESULTS: Test results can take up to five days to process. If your results are positive, a Sharp Clinician will call you. If your results are negative, you will receive an automated call. COVID test results can be found in FollowMyHealth for Sharp HealthCare members with a FollowMyHealth account.

FOR COPIES OF COVID TEST: Go to sharp.com/covidresults to learn how to obtain a copy of your test results.

Facility: **Sharp Memorial Hospital**

Suicide Prevention Info : *If you, or anyone you know, has or is having thoughts of suicide, call 911 or the local San Diego Access and Crisis Line, 1-888-724-7240 or the National Suicide Prevention Lifeline, 1-800-273-TALK (8255).*

General Community Resource Line - Call 211 or go to www.211sandiego.org/home

Smoking Cessation Info: *If you or a member of your family smoke, your Doctor and Health Team strongly advise you to STOP smoking. Suggestions that may help you:*

Please consult your doctor or nurse for help.

Contact a smoking cessation program for assistance:

Second Breath: 1-800-82 SHARP or 858-627-5340

Kick It California: 800-300-8086

If you are experiencing homelessness or use shelters at night, you are at higher risk for certain infections. For further screening of infections that may be infectious or easily passed onto other people, please call the Family Health Centers of San Diego for information about the location nearest you at (619) 515-2551.

Special Instructions

Due to the possibility of serious risk of injury, including death, children ***MUST*** be secured in an appropriate child passenger restraint (safety seat or booster) **IN THE BACK SEAT OF A VEHICLE** until they are at least 8 YEARS OLD or 4' 9" in height.

Children less than 2 years of age must ride in a rear-facing car seat unless the child weighs 40 or more pounds or is 40 or more inches tall.

Should you have any questions about the requirements, installation, or inspection of your infant's car seat, contact the San Diego office of the California Highway Patrol at (619) 220-5492.

View your health information and discharge instructions at sharp.com/followmyhealth. Learn about more ways to view your health information at sharp.com/healthapps.

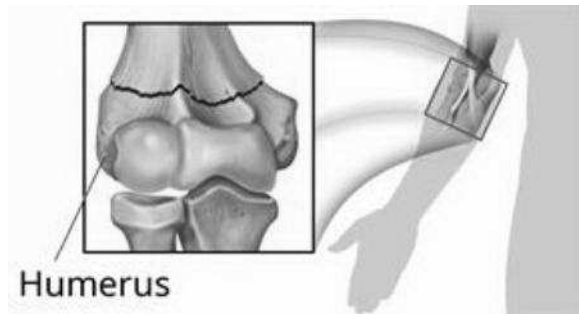

For additional physician options call our Physician Referral Service at 1-800-82-SHARP.

Patient Education Materials

Emergency Documentation

HANDROP, RONALD S has been given the following patient education materials:

Distal Humerus Elbow Fracture

A distal humerus elbow fracture is a break in the upper arm bone (humerus). The break happens in the lower (distal) part of the humerus, near the elbow.

What are the causes?

This condition may be caused by:

- A hard, direct hit. This may happen as a result of being hit with an object, being in a motor vehicle accident, or having a collision with another person.
- Falling onto an outstretched arm.

What increases the risk?

You are more likely to develop this condition if:

- You are young.
- You are elderly and have low bone density(osteoporosis).
- You participate in activities where you are likely to have an injury or a fall, such as:
 - Gymnastics.
 - Football and other contact sports.
 - Skateboarding.
 - Biking.

What are the signs or symptoms?

Symptoms of this condition include:

Emergency Documentation

- Pain that is sudden and severe.
- Tenderness of the elbow as well as the area near the elbow.
- Inability to move the elbow or straighten the arm.
- Swelling of the elbow.
- Bruising.
- Stiffness.
- A feeling that the elbow is unstable.

In severe cases, the bone can protrude through the skin. This type of elbow fracture is a medical emergency.

How is this diagnosed?

This condition is diagnosed based on your symptoms, your medical history, and a physical exam.

You may also have X-rays to confirm the diagnosis.

How is this treated?

This condition may be treated by:

- Wearing a splint or cast and a sling to hold your elbow still (immobilized) while it heals.
- Applying ice to your elbow to relieve pain and reduce swelling.
- Taking NSAIDs, such as ibuprofen, to reduce pain and swelling.
- Doing exercises to help you regain movement (physical therapy).
- Having surgery if the bones in your elbow are out of position.

Follow these instructions at home:**Medicines**

- Take over-the-counter and prescription medicines only as told by your health care provider.
- Ask your health care provider if the medicine prescribed to you:
 - Requires you to avoid driving or using heavy machinery.
 - Can cause constipation. You may need to take these actions to prevent or treat constipation:
 - Drink enough fluid to keep your urine pale yellow.
 - Take over-the-counter or prescription medicines.

Emergency Documentation

- Eat foods that are high in fiber, such as beans, whole grains, and fresh fruits and vegetables.
- Limit foods that are high in fat and processed sugars, such as fried or sweet foods.

If you have a cast or splint:

- **Do not** put pressure on any part of the cast or splint until it is fully hardened. This may take several hours.
- Check the skin around it every day. Tell your health care provider about any concerns.

If you have a cast:

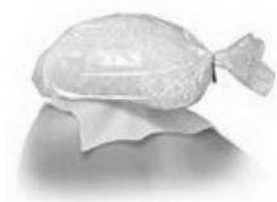

- **Do not** stick anything inside it to scratch your skin. Doing that increases your risk of infection.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath it.
- Keep it clean and dry.

If you have a splint or sling:

- Wear it as told by your health care provider. Remove it only as told by your health care provider.
- Loosen it if your fingers tingle, become numb, or turn cold and blue.
- Keep it clean and dry.

Bathing

- **Do not** take baths, swim, or use a hot tub until your health care provider approves. Ask your health care provider if you may take showers. You may only be allowed to take sponge baths.
- If the cast, splint, or sling is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a waterproof covering when you take a bath or shower.

Managing pain, stiffness, and swelling

Emergency Documentation

- If directed, put ice on the injured area.
 - If you have a removable splint or sling, remove it as told by your health care provider.
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag or between your cast and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- Move your fingers often to reduce stiffness and swelling.
- Raise (elevate) the injured area above the level of your heart while you are sitting or lying down.

Activity

- Ask your health care provider when it is safe to drive if you have a cast, splint, or sling on your arm.
- Do exercises as told by your health care provider.
- Return to your normal activities as told by your health care provider. Ask your health care provider what activities are safe for you.

Safety

- **Do not** use the injured limb to support your body weight until your health care provider says that you can.
- **Do not** lift anything that is heavier than 10 lb (4.5 kg), or the limit that you are told, until your health care provider says that it is safe.
- **Do not** pull or push objects with your injured arm until your health care provider says that it is safe.

General instructions

- **Do not** use any products that contain nicotine or tobacco, such as cigarettes, e-cigarettes, and chewing tobacco. These can delay bone healing. If you need help quitting, ask your health care provider.
- Keep all follow-up visits as told by your health care provider. This is important.

How is this prevented?

- Wear the appropriate protective equipment during sports, such as elbow pads.
- Make sure to use equipment that fits you.
- Maintain physical fitness, including:
 - Strength.
 - Flexibility.

Emergency Documentation**Contact a health care provider if you have:**

- Pain that gets worse or does not improve.

Get help right away if you have:

- Ongoing numbness or weakness in your elbow, hand, or fingers.
- Discoloration of your fingers.
- Severe pain that is much worse or different than before.
- Swelling that suddenly worsens.

Summary

- A distal humerus elbow fracture is a break in the upper arm bone (humerus) near the elbow.
- This condition may be caused by a hard, direct hit or falling onto an outstretched arm.
- This condition is often treated with a splint or cast and a sling to hold your elbow still (immobilized) while it heals. Surgery may be needed if the bones in your elbow are out of position.
- Contact your health care provider if you have pain that gets worse or does not improve.

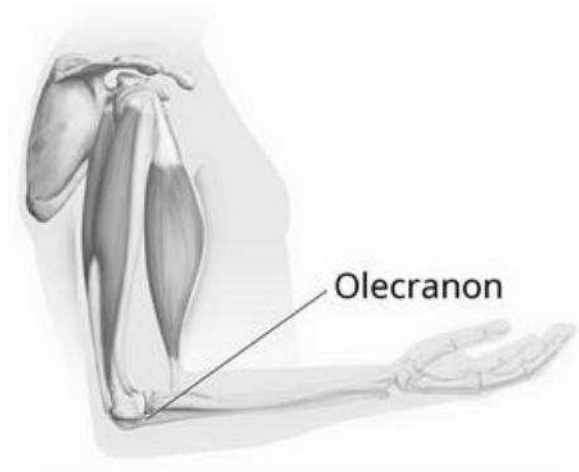

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

Document Revised: 04/08/2020 Document Reviewed: 02/26/2020
Elsevier Patient Education © 2021 Elsevier Inc.

Olecranon Fracture

An olecranon fracture is a break in one of the bones of your elbow. Three bones make up your elbow. These include the two bones of your lower arm (ulna and radius) and the single bone of your upper arm (humerus). The tip of your elbow (olecranon) is part of your ulna. You can feel this hard tip when you bend your elbow. It is easily injured because it has very little padding over it.

What are the causes?

Emergency Documentation

Olecranon fractures commonly occur after falling on a hard surface with a bent elbow. Other causes include:

- A forceful hit (blow) to the elbow.
- A motor vehicle collision.
- Falling onto an outstretched arm.
- A forceful twist to the elbow.

What increases the risk?

You are more likely to develop this condition if you:

- Participate in contact sports or sports in which falls on hard surfaces are common.
- Are older. This is when falls are more common.
- Have thin or weak bones.

What are the signs or symptoms?

Symptoms of this condition include:

- Severe pain, especially when you try to move your elbow.
- Swelling.
- Bruising.
- Stiffness.
- Pain or tenderness in your elbow when it is touched.

Emergency Documentation

- Numbness in your fingers.

How is this diagnosed?

This condition is diagnosed based on a physical exam and X-rays.

How is this treated?

Treatment depends on the severity and location of the fracture. Many fractures can be treated without surgery. Treatment may include:

- Taking pain medicine.
- Icing the injury to reduce swelling.
- Keeping the elbow still with a cast, splint, or sling (immobilization).
- Doing physical therapy to restore movement.

If the elbow is not stable or if bones are out of place, you may need surgery. You may have pins, wires, screws, or plates inserted into the broken bone. Then, you will need to wear a splint, cast, or sling and have physical therapy to restore movement.

Follow these instructions at home:**Medicines**

- Take over-the-counter and prescription medicines only as told by your health care provider.
- Ask your health care provider if the medicine prescribed to you:
 - Requires you to avoid driving or using heavy machinery.
 - Can cause constipation. You may need to take actions to prevent or treat constipation, such as:
 - Drink enough fluid to keep your urine pale yellow.
 - Take over-the-counter or prescription medicines.
 - Eat foods that are high in fiber, such as beans, whole grains, and fresh fruits and vegetables.
 - Limit foods that are high in fat and processed sugars, such as fried or sweet foods.

If you have a splint or sling:

- Wear the splint or sling as told by your health care provider. Remove it only as told by your health care provider.

Emergency Documentation

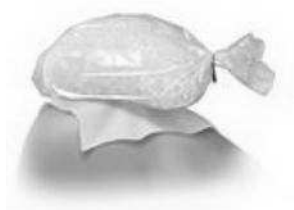

- Loosen the splint or sling if your fingers tingle, become numb, or turn cold and blue.
- Keep the splint or sling clean and dry.

If you have a cast:

- **Do not** put pressure on any part of the cast until it is fully hardened. This may take several hours.
- **Do not** stick anything inside the cast to scratch your skin. Doing that increases your risk of infection.
- Check the skin around the cast every day. Tell your health care provider about any concerns.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath the cast.
- Keep the cast clean and dry.

Bathing

- **Do not** take baths, swim, or use a hot tub until your health care provider approves. Ask your health care provider if you may take showers. You may only be allowed to take sponge baths.
- If the cast, splint, or sling is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a waterproof covering when you take a bath or shower.

Managing pain, stiffness, and swelling

- If directed, put ice on the injured area.
 - If you have a removable splint or sling, remove it as told by your health care provider.
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag or between your cast and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- Move your fingers often to reduce stiffness and swelling.

Emergency Documentation

- Raise (elevate) the injured area above the level of your heart while you are sitting or lying down.

Activity

- Return to your normal activities as told by your health care provider. Ask your health care provider what activities are safe for you. You may not be able to lift anything with your arm for several weeks.
- Do exercises as told by your health care provider or physical therapist.

General instructions

- **Do not** use any products that contain nicotine or tobacco, such as cigarettes, e-cigarettes, and chewing tobacco. These can delay bone healing. If you need help quitting, ask your health care provider.
- Ask your health care provider when it is safe to drive if you have a cast, splint, or sling on your arm.
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if:

- You have pain that gets worse.
- Your hand and fingers swell.
- Your cast or splint becomes loose or damaged.

Get help right away if:

- You lose feeling in your hand or fingers.
- Your hand or fingers get cold or turn pale or blue.

Summary

- An olecranon fracture is a break in one of the bones of your elbow.
- Olecranon fractures commonly occur after falling on a hard surface with a bent elbow.
- Treatment depends on the severity and location of the fracture.
- It is treated with ice, pain medicine, keeping the elbow still (immobilization), physical therapy, and surgery if needed.

Radiology Studies:

If you had any radiology studies (x-rays, CT scans, MRI scans, Ultrasound scans, Vascular studies) performed, they will be reviewed by the radiologist. The emergency physician reviewed the preliminary results with you. The radiology department will make the final interpretation of your radiology study. When scheduling your follow up appointment with your physician, please verify with the physician's office if they have digital access to your x-rays or if you will need to pick up hard copies before your appointment. Ask your physician to check on the official radiology report by calling the x-ray files department at (858) 939-4606. If you need hard copies, please call the x-ray department at (858) 939-4606 to arrange to pick up your x-rays.

Home Medication Instructions

The accuracy of your home medication list is based on information provided by you (the patient), family, or other sources during your emergency department visit today. It is recommended that your primary physician, your other physicians, and your pharmacist review all new and current medications for interactions, as well as any medication dosage changes, at the time of your first follow up or when filling your prescription. This medication list should be updated and carried with you in the event of an emergency.

PROCEDURE
CT Elbow w/o Contrast Right

EXAM DATE/TIME
10/18/2023 23:46 PDT

ORDERING PROVIDER
Marzec MD,Karl

Reason For Exam

(CT Elbow w/o Contrast Right) Injury, elbow to wrist; Injury, elbow to wrist

Interpretation

EXAMINATION: CT Elbow w/o Contrast Right

HISTORY: Injury, elbow to wrist. ,

COMPARISON: None

TECHNIQUE: Multidetector CT imaging of the right elbow without IV contrast sagittal and coronal images are reconstructed. This exam was performed using dose optimization techniques including automated exposure control, adjustment of mA and/or kV according to patient size, and/or iterative reconstruction.

FINDINGS:

Osseous structures: There are 2 tiny osseous fragments about the coronoid and olecranon processes of the ulna. Similar osseous fragment about the posterior olecranon soft cutaneous soft tissues also noted. There is mild impaction about the lateral posterior humerus, best seen on image #20 of series 601. Radial head appears intact.

Joints: Resting joint spaces and alignment are normal. No significant joint effusion.

Muscles: Normal bulk and architecture for age.

Neurovascular structures: Not well assessed owing to the lack of intravenous contrast, but grossly normal.

Soft tissues: Unremarkable

Other: None.

IMPRESSION:

1. Small osseous fragments about the coronoid and olecranon processes of the ulna, suggestive of recent avulsion injuries.
2. Apparent nondisplaced mild impaction fracture about the posterior lateral humerus nonarticular surface.

This exam was performed at: Sharp Memorial Hospital

CT Head w/o Contrast

EXAM DATE/TIME

10/18/2023 22:24 PDT

ORDERING PROVIDER

Marzec MD,Karl

Reason For Exam

(CT Head w/o Contrast) Injury, head, initial encounter; Injury, head, initial encounter

Interpretation

EXAM: CT Head w/o Contrast

CLINICAL INDICATION: Injury, head, initial encounter

TECHNIQUE: CT images from skull base to vertex without IV contrast. This exam was performed using dose optimization techniques including automated exposure control, adjustment of mA and/or kV according to patient size, and/or iterative reconstruction.

COMPARISON: None.

FINDINGS:

Parenchyma/Extra-axial Spaces: No CT evidence of a large territorial infarction. No hemorrhage. Nonspecific prominent extra-axial space over the right parietal convexity could be secondary to asymmetric volume loss or an underlying arachnoid cyst. No midline shift or intracranial herniation. No cerebellar tonsillar ectopia.

Ventricles: No hydrocephalus.

Bones/Soft tissues/Surgical changes: No acute osseous or soft tissue abnormality.

Included Orbits: Right lens replacement with scleral banding.

Paranasal Sinuses: Patchy paranasal sinus mucosal thickening. Right maxillary sinus mucous retention cyst or polyp.

Tympanomastoid Cavities: Predominantly clear.

Other: Atherosclerotic intracranial calcifications are present.

IMPRESSION:

No acute traumatic intracranial abnormality.

PROCEDURE

CT Spine Cervical w/o
Contrast

EXAM DATE/TIME

10/18/2023 22:24 PDT

ORDERING PROVIDER

Marzec MD,Karl

Reason For Exam

(CT Spine Cervical w/o Contrast) _Neck injury, acute;_Neck injury, acute

Interpretation

EXAM: CT Spine Cervical w/o Contrast

CLINICAL INDICATION: _Neck injury, acute.

TECHNIQUE: Helical CT examination of the cervical spine without IV contrast. Axial, sagittal, and coronal reconstructed images. This exam was performed using dose optimization techniques including automated exposure control, adjustment of mA and/or kV according to patient size, and/or iterative reconstruction.

COMPARISON: None.

FINDINGS:

Alignment: Straightening of the normal cervical lordosis which may be positional in etiology or related to muscle spasm.

Vertebral Bodies: No acute fracture. Nonspecific sclerotic lesion along the right aspect of the T1 superior endplate measuring approximately 1 cm.

Intervertebral Discs: Multi-level loss of disc space height.

Craniocervical Junction: Degenerative changes with intact alignment

Included Intracranial Structures: Please see dedicated CT head on same day for description of intracranial findings.

Paraspinal and Neck Soft Tissues: No suspicious cervical lymphadenopathy.

Included Lung Apices: No pneumothorax in the field of view. Presumed dependent subsegmental ectasis of the imaged lung apices

Facility: **Sharp Memorial Hospital**

HANDROP, RONALD S

SHC#: 100-962-224

Admit: 10/18/2023

FIN: 47089684

Disch: 10/19/2023

DOB/Age/Sex: 12/7/1954 68 years Male

Computed Tomography

Interpretation

Individual Levels: Posterior disc-osteophyte complexes, uncovertebral hypertrophy, and bulky facet arthropathy with multilevel severe neuroforaminal stenosis.

IMPRESSION:

No acute fracture or traumatic malalignment on CT of the cervical spine without contrast.

Indeterminate sclerotic lesion abutting the superior endplate on the right aspect of the T1 vertebral body measuring approximately 1 cm. Differential diagnosis would include a bone island however, malignancy/metastasis is not definitely excluded. Correlate for any history of malignancy.

Reason For Exam

(XR Chest 1 View) Chest pain, unspecified;Chest pain, unspecified

Interpretation

EXAMINATION: XR Chest 1 View

HISTORY: .

COMPARISON: 11/7/2019

TECHNIQUE: Portable AP view of the chest.

FINDINGS:

Facility: **Sharp Memorial Hospital**

HANDROP, RONALD S

SHC#: 100-962-224

Admit: 10/18/2023

FIN: 47089684

Disch: 10/19/2023

DOB/Age/Sex: 12/7/1954 68 years Male

Diagnostic Radiology

Interpretation

Lines/tubes: None.

Pleura: There is no pleural effusion or pneumothorax.

Lungs: Hazy and patchy opacities in right greater than left lower lobes.

Cardiomediastinal silhouette: Within normal limits for age.

Bones: No obvious acute osseous abnormality.

IMPRESSION:

Hazy and patchy bibasilar lung opacities may represent atelectasis versus developing pneumonia.

Diagnostic Radiology

Interpretation

EXAMINATION: XR Elbow Complete Right

HISTORY: Injury, elbow to wrist

COMPARISON: None

FINDINGS:

No definite acute fracture dislocation is seen. No significant joint effusion is present. There is minimal cortical irregularity along the olecranon which favored to represent chronic injury. Mild soft tissue swelling. No radiopaque foreign body.

IMPRESSION:

No definite acute displaced fracture or dislocation. Minimal cortical irregularity along the olecranon of ulna favored to represent chronic injury. If there remains clinical concern for acute osseous abnormality, consider CT scan.
